I am trying to extract the database backup (.sql file) from SQL Server 2012. But i am not able to find where it is saved in the disk. I am using Sql Server Management Studio and have the database as a standalone instance. I can backup and restore the database through SQL Server Management Studio. But I need to extract the backup in order to transfer to another server. Can you please guide me? A: Assuming you're on a Windows machine, look in the SQL Server Data Files folder under: C:\Program Files\Microsoft SQL Server\MSSQL10\_50.MSSQLSERVER\MSSQL\DATA You'll see.MSSQLSERVER and.MSSQL11 folders in there. That folder contains the database backups. Since the file is not just dropped in there, you probably want to read the SQL Server DB Engine Logs folder first, which might have the name of the database it was backed up for. The error was returned because the package is trying to change the selinux label of an object in the system with security label SELinux=enforcing. When SELinux is enforcing labels on the system, it prevents this action completely. It is recommended that this package be fixed as soon as possible, if you are using this package. Otherwise, you can disable SELinux temporarily during this installation by executing the following command as root

Extremely powerful, macro recording and editing software, using timer, stopwatch and date functions. Its user-friendly interface with a built-in template editor has long been an advanced alternative for the more sophisticated software, offering more professional features. KeyMacro integrates a comprehensive language translator to allow importing and editing. The integrated document generator offers a wide range of templates for creating web pages, e-mails, reports, signs, banners, flyers, and much more. Its spreadsheet function can create tables, charts, formulas, and SQL queries. KeyMacro contains a virtual re-touching and re-arranging tools, time and date filters, sequencer, and a variety of audio tracks. KeyMacro and the database: database records are about the same size as text records, for the most part, and can be accessed quickly and easily. Unlike text records, database records are much less sensitive to formatting and don't require careful parsing of the data. Text records usually do not contain any formatting, or text qualifiers that have to be removed to display the text as the record is parsed. For example, if you were using a regular expression to strip out a word from a record, you have to know the size of the word (even if it's only a couple of characters) to correctly strip out the word. However, with a database record, you don't have to worry about any formatting issues. Advantages of the database: Database records offer many advantages over text records: they are much smaller in size, they can be accessed quickly, and they are much more flexible, since you can add or remove fields with the addition of new records and can do so without having to re-parse the entire text record. KeyMacro also offers several features that are not available in other programs: Import/export, export to PDF/EPUB, re-ordering, programmable recording, size/weight, and date formatting. KeyMacro's features: A record represents a series of keystrokes, timer starts and stops, and dates. The database records can contain settings for text qualifiers, labels, separators, and more. It can be exported as EPUB, PDF, and other formats. The format can be re-arranged using a sort or drag-and-drop. Templates can be imported into the program. Database templates: In addition to the program templates, there is a set of "excel templates" available in the "Database" section. This allows you to 2edc1e01e8
