Bile can be a corrosive and harmful substance if not properly handled. It can be used as a pharmaceutical and as a detergent. It can be used in food coloring, chocolate making, or in beer production. Most importantly, bile is a component in the synthesis of most vitamins and certain

hormones. This means that we humans have to eat our way through a natural, and thus dangerous, supply of bile in order to get a good amount of bile into our bodies. This is the reason why a piece of meat from a cow or from a lamb or a chicken can have a distinctly different flavor depending on which part of the animal the meat comes from. If one looks at the bile of an animal, the same applies. While bile is most commonly associated with the digestion of fats, it is also essential for the production of cholesterol, hormones, and certain vitamins. A classic bile regurgitation test can be performed to check for adequate liver function. The picture below is of a bile regurgitation test.

Diagnosis of group A beta-hemolytic streptococcal infection in children. Group A streptococci have emerged as an important pathogen associated with pharyngitis in children. Rapid microbiologic methods to identify the organisms are necessary to begin antimicrobial therapy. A multiplex real-time polymerase chain reaction (PCR) assay targeting the genes encoding the superantigen SpeA, streptolysin O, and the streptococcal mitogen-activated protein kinase was used to detect group A streptococci in throat swab specimens collected from children and adults with pharyngitis. The assay detected 598 of 596 (99.7%) group A streptococcal strains tested. The assay can be completed in 4.5 hours compared with 18.5 hours for culture. The assay may be useful in children in whom the organism is suspected but culture is not available.

The development and maintenance of the adipocyte: role of lipolytic hormones. Lipolytic hormones, especially catecholamines, are the main regulators of lipolysis. Other regulatory mechanisms include phosphorylation and inactivation of hormone-sensitive lipase (HSL), protein kinase C, and a ubiquitin-proteasome pathway that results in degradation of HSL. There is recent evidence that circulating hormones and/or adipocyte-derived hormones also regulate lipolysis in adipose tissues. The importance of these actions on metabolism is still under investigation.
